

LEGIONELLA DOSSIER

THE NO. 1 LEGIONELLA CONTROL PLATFORM

Keep your buildings safe & compliant with a digital logbook & IoT sensors.

GET FULL CONTROL ON LEGIONELLA

Legionella prevention & control is a complex field, involving labour-intensive procedures, time-consuming paperwork and repetitive tasks, such as flushing, keeping records, scheduling tasks and staying compliant.

Work together in a collaborative platform

That's why we developed **LD-Control** – an all-in-one digital logbook for all your buildings to help you maintain documents and perform tasks while remaining fully L8 and HSG274 compliant.

You can also work more closely with your Legionella control service provider as you both work in the same platform. Giving you real time data, a clear overview and a more streamlined way of working.

Make it quicker and easier

Our app eliminates the hassle of hard copy logbooks for evermore and even checks off flushing tasks automatically in your digital logbook as you complete them.

All documents, schematics and certificates are kept up-to-date in one central online location and you can generate complete logbooks with a click of a button.

Receive automatic task notifications & reminders

Using our app, you can schedule and assign tasks to your staff so that only relevant and current action items show up on their devices. Notifications and reminders ensure staff never miss a task. Nonetheless, we've put fallbacks in place in case they do, for example by re-assigning tasks to other available staff members.

What's more, our system automatically prompts you or the person responsible to take action if a non-compliance arises or a user enters a comment or a request for action or follow-up.

Get real-time insights with our smart dashboards

Our smart dashboards keep you fully up-to-date, displaying tasks completed, active non-compliances and much, much more. They even allow you to zoom in on management data, detect trends and improve your Legionella control & prevention measures.

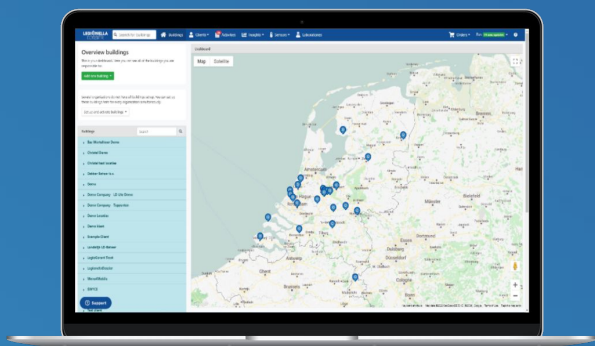

SAVE TIME WITH REMOTE MONITORING SENSORS

Say hello to Clip'R – your smart IoT remote monitoring sensor

It doesn't get much easier than this. Using our Clip'R sensors and software, you can perform, record and archive all your Legionella prevention tasks automatically:

- ➔ Flushing pipes
- ➔ Taking temperature readings
- ➔ Generating tasks for vacant rooms

Clip'R monitors and records temperatures without missing a single non-compliance, as often happens when taking temperature readings manually. You can set custom alert thresholds and have notifications forwarded automatically to the person responsible so they can take immediate action and keep your buildings' water systems safe.

Clip'R monitors water usage and records temperatures inside pipes accurately and correctly, making it even easier for the person responsible to manage your Legionella control processes. What's more, Clip'R also notifies the person responsible about any manual tasks they should perform whenever it detects zero usage over a predefined period.
